Topology

1.1 Topological Spaces

Definition 1.1.1 ► Topology

A **topology** on a set X is a collection $\mathcal{T} \subseteq \mathcal{P}(X)$ such that

- $\emptyset, X \in \mathcal{T}$;
- for any index set I , if $\{X_i : i \in I\} \subseteq \mathcal{T}$, then $\bigcup_{i \in I} X_i \in \mathcal{T}$;
- for any $X_1, X_2, \dots, X_n \in \mathcal{T}$, $\bigcap_{i=1}^n X_i \in \mathcal{T}$.

The pair (X, \mathcal{T}) is said to be a **topological space**. A subset $Y \subseteq X$ is **open** if $Y \in \mathcal{T}$.

Remark. For any set X , we define $\{\emptyset, X\}$ as the *trivial topology* on X , $\mathcal{P}(X)$ as the *discrete topology*, and $\{X \setminus U : U \subseteq X \text{ is finite}\} \cup \{\emptyset\}$ as the *co-finite topology*.

The set $\{(-\alpha, \alpha) : \alpha > 0\} \cup \{\mathbb{R}, \emptyset\}$ defines a topology on \mathbb{R} . This example also demonstrates why it is crucial to only consider closure under finite intersections when defining a topology, because

$$\bigcap_{n=1}^{\infty} \left(-1 - \frac{1}{n}, 1 + \frac{1}{n}\right) = [-1, 1] \notin \mathcal{T}.$$

We now seek a systematic method to generate a topology given any set. The idea here is to make use of a *cover*.

Definition 1.1.2 ► Basis

A **basis** for a topology on X is a collection $\mathcal{B} \subseteq \mathcal{P}(X)$ such that

- for any $x \in X$, there exists some $B \in \mathcal{B}$ such that $x \in B$;
- for any $x \in X$ and $B_1, B_2 \in \mathcal{B}$ with $x \in B_1 \cap B_2$, there exists some $B \in \mathcal{B}$ such that $x \in B \subseteq B_1 \cap B_2$.

It may be useful to see a basis as a cover of a set with the second additional property as stated in the above definition. Notice that the first property of the basis \mathcal{B} is basically saying that

$$X \subseteq \bigcup \mathcal{B},$$

i.e., \mathcal{B} is a cover of X .

Given any basis \mathcal{B} for some topology on X , a set generated by \mathcal{B} can be defined as

$$\mathcal{T} := \{U \subseteq X : \text{for any } u \in U, \text{ there exists some } B \in \mathcal{B} \text{ such that } u \in B \subseteq U\}$$

We will show that \mathcal{T} is a topology on X . First, it is clear that $\emptyset, X \in \mathcal{T}$.

Let I be an index set and $\{X_i : i \in I\} \subseteq \mathcal{P}(X)$ be any collection of subsets of X . Notice that for any $x \in \bigcup_{i \in I} X_i$, there exists some $j \in I$ such that $x \in X_j \subseteq \mathcal{T}$. According to our construction, this means that there exists some $B \in \mathcal{B}$ such that $x \in B \subseteq X_j \subseteq \mathcal{T}$. Therefore, $\bigcup_{i \in I} X_i \subseteq \mathcal{T}$ as desired.

To prove that \mathcal{T} is closed under finite intersection, we consider the following lemma:

Lemma 1.1.3 ▶ Finite Intersection of Elements in Basis Is Covered

Let \mathcal{B} be a basis for a topology on X and $B_1, B_2, \dots, B_n \in \mathcal{B}$, then for any $x \in \bigcap_{i=1}^n B_i$, there exists some $B \in \mathcal{B}$ such that $x \in B \subseteq \bigcap_{i=1}^n B_i$.

Proof. The case where $n = 1$ is trivial by taking $B = B_1$. Suppose that there is some integer $k \geq 1$ such that for any $B_1, B_2, \dots, B_k \in \mathcal{B}$ and any $x \in \bigcap_{i=1}^k B_i$, there exists some $B \in \mathcal{B}$ such that $x \in B \subseteq \bigcap_{i=1}^k B_i$. Take any $B_{k+1} \in \mathcal{B}$. It is clear that for any $x \in \bigcap_{i=1}^{k+1} B_i$, there exists some $B \in \mathcal{B}$ such that

$$x \in B \subseteq \bigcap_{i=1}^k B_i.$$

Notice that $x \in B_{k+1} \in \mathcal{B}$, so we know that $x \in B \cap B_{k+1}$. By Definition 1.1.2, this means that there exists some $B' \in \mathcal{B}$ such that

$$x \in B' \subseteq B \cap B_{k+1} \subseteq \bigcap_{i=1}^{k+1} B_i.$$

□

Now, suppose $X_1, X_2, \dots, X_n \in \mathcal{T}$ are finitely many subsets of X . Take any $x \in \bigcap_{i=1}^n X_i$. It is clear that $x \in X_i$ for each $i = 1, 2, \dots, n$. Therefore, for each $i = 1, 2, \dots, n$, there exists some $B_i \in \mathcal{B}$ such that $x \in B_i \subseteq X_i$. By Lemma 1.1.3, this means that there exists some set $B \in \mathcal{B}$ such that

$$x \in B \subseteq \bigcap_{i=1}^n B_i \subseteq \bigcap_{i=1}^n X_i.$$

Therefore, $\bigcap_{i=1}^n X_i \in \mathcal{T}$. So this set \mathcal{T} generated by \mathcal{B} is indeed a topology on X .

The following proposition further shows that the topology generated by a basis \mathcal{B} is the set

of all possible unions of elements in \mathcal{B} :

Proposition 1.1.4 ▶ Equivalent Construction of Topologies Generated from Bases

Let X be any set. If \mathcal{B} is a basis for a topology \mathcal{T} on X , then

$$\mathcal{T} = \left\{ \bigcup_{A \in \mathcal{V}} A : \mathcal{V} \in \mathcal{P}(\mathcal{B}) \right\}.$$

Proof. Denote

$$\mathcal{T}_{\mathcal{B}} := \{U \subseteq X : \text{for any } u \in U, \text{ there exists some } B \in \mathcal{B} \text{ such that } u \in B \subseteq U\}.$$

It suffices to prove that $\mathcal{T} = \mathcal{T}_{\mathcal{B}}$. Take any $T \in \mathcal{T}$, then there exists some $\mathcal{V} \in \mathcal{P}(\mathcal{B})$ such that $T = \bigcup_{A \in \mathcal{V}} A$. This means that for every $t \in T$, there exists some $B_t \in \mathcal{V}$ such that $t \in B_t \subseteq T$. Therefore, $T \in \mathcal{T}_{\mathcal{B}}$. Conversely, for any $S \in \mathcal{T}_{\mathcal{B}}$, there exists some $B_s \in \mathcal{B}$ for each $s \in S$ such that $s \in B_s$. Denote $\mathcal{U} := \{B_s : s \in S\} \in \mathcal{P}(\mathcal{B})$, then it is clear that $S \subseteq \bigcup_{B \in \mathcal{U}} B$. Since $B_s \subseteq S$ for each $s \in S$, we have $\bigcup_{B \in \mathcal{U}} B \subseteq S$, which implies that $S = \bigcup_{B \in \mathcal{U}} B$. This means that $S \in \mathcal{T}$. Therefore, $\mathcal{T} \subseteq \mathcal{T}_{\mathcal{B}}$ and $\mathcal{T}_{\mathcal{B}} \subseteq \mathcal{T}$, which means that $\mathcal{T} = \mathcal{T}_{\mathcal{B}}$. \square

Next, we define a special topology in Euclidean spaces using open balls.

Definition 1.1.5 ▶ Standard Topology

For any $\mathbf{x} = (x_1, x_2, \dots, x_n) \in \mathbb{R}^n$ and any $r > 0$. Denote the Euclidean open ball centred at \mathbf{x} with radius r by

$$B_r(\mathbf{x}) := \left\{ \mathbf{y} = (y_1, y_2, \dots, y_n) \in \mathbb{R}^n : \sqrt{\sum_{i=1}^n (x_i - y_i)^2} < r \right\}$$

The **standard topology** on \mathbb{R}^n is the set generated by the basis

$$\mathcal{B} := \{B_r(\mathbf{x}) : \mathbf{x} \in \mathbb{R}^n, r \in \mathbb{R}^+\}.$$

It may be helpful to actually show that this set \mathcal{B} is indeed a basis of a topology on \mathbb{R}^n . The fact that \mathcal{B} is a cover for \mathbb{R}^n is trivial enough. Take any $\mathbf{x} \in \mathbb{R}^n$ and balls $B_{\alpha}(\mathbf{x}_1), B_{\beta}(\mathbf{x}_2) \in \mathcal{B}$ such that $\mathbf{x} \in B_{\alpha}(\mathbf{x}_1) \cap B_{\beta}(\mathbf{x}_2)$ (the existence of these 2 balls is again trivial enough). Take

$$r = \min \{\alpha - \|\mathbf{x} - \mathbf{x}_1\|, \beta - \|\mathbf{x} - \mathbf{x}_2\|\}.$$

Clearly, $r > 0$ and $\mathbf{x} \in B_r(\mathbf{x})$, so we are done.

Now, we discuss the analogue of the subset relation in topologies.

Definition 1.1.6 ► Fineness and Coarseness

Let \mathcal{T} and \mathcal{T}' be topologies on some set X . We say that \mathcal{T} is **finer** than \mathcal{T}' , or equivalently, that \mathcal{T}' is **coarser** than \mathcal{T} , if $\mathcal{T}' \subseteq \mathcal{T}$.

Observe that any topology of X must be a subset of $\mathcal{P}(X)$, which is the discrete topology on X , so the discrete topology is the finest topology on a set.

Remark. For any basis \mathcal{B} for a topology on X , the topology generated by \mathcal{B} is the coarsest topology containing \mathcal{B} .

The above remark is easy to verify. Let \mathcal{T} be any topology on X with $\mathcal{B} \subseteq \mathcal{T}$ and $\mathcal{T}_{\mathcal{B}}$ be the topology generated by \mathcal{B} . For any $T \in \mathcal{T}_{\mathcal{B}}$, by Proposition 1.1.4, there exists some $V \subseteq \mathcal{B}$ such that $T = \bigcup_{A \in V} A$. Note that $A \in \mathcal{T}$ for all $A \in \mathcal{V}$, so by Definition 1.1.1, $T \in \mathcal{T}$ and so $\mathcal{T}_{\mathcal{B}} \subseteq \mathcal{T}$ as desired.

This motivates us to consider fineness in terms of bases.

Proposition 1.1.7 ► Fineness in Terms of Bases

Let \mathcal{B} and \mathcal{B}' generate topologies \mathcal{T} and \mathcal{T}' respectively on X . \mathcal{T}' is finer than \mathcal{T} if and only if for every $B \in \mathcal{B}$ and any $x \in B$, there exists some $B_x \in \mathcal{B}'$ such that $x \in B_x \subseteq B$.

Proof. Suppose that \mathcal{T}' is finer than \mathcal{T} , then $\mathcal{T} \subseteq \mathcal{T}'$. Take any $B \in \mathcal{B}$, then by Proposition 1.1.4, $B \in \mathcal{T}$, which means that $B \in \mathcal{T}'$. Since \mathcal{B}' is a basis for \mathcal{T}' , by Definition 1.1.2 for any $x \in B$, there exists some $B_x \in \mathcal{B}'$ such that $x \in B_x \subseteq B$.

Suppose conversely that for every $B \in \mathcal{B}$ and any $x \in B$, there is some $B_x \in \mathcal{B}'$ such that $x \in B_x \subseteq B$. Take any $T \in \mathcal{T}$, for each $x \in T$, by Definition 1.1.2 there exists some $B \in \mathcal{B}$ such that $x \in B \subseteq T$, and so we can find some $B_x \in \mathcal{B}'$ such that $x \in B_x \subseteq B \subseteq T$, so $T \in \mathcal{T}'$. Therefore, $\mathcal{T} \subseteq \mathcal{T}'$ and so \mathcal{T}' is finer than \mathcal{T} . \square

Recall that every basis of a topology on X is an open cover of X consisting only of subsets of X . Therefore, the union of the elements in the basis is essentially X itself. This motivates us to propose another way to generate a topology on a set.

Definition 1.1.8 ► Sub-basis

A **sub-basis** of X is a collection $\mathcal{S} \subseteq \mathcal{P}(X)$ such that $\bigcup_{A \in \mathcal{S}} A = X$.

Remark. Every basis is a sub-basis.

For an arbitrary set X , let \mathcal{S} be a sub-basis and denote the collection of all finite subsets of $\mathcal{P}(\mathcal{S})$ as $\mathcal{F}_{\mathcal{S}}$. Define

$$\mathcal{U}_{\mathcal{S}} := \left\{ \bigcap_{A \in F} A : F \in \mathcal{F}_{\mathcal{S}} \right\}$$

to be the collection of all finite intersections of sets in \mathcal{S} . The topology generated by a sub-basis of X is given by

$$\mathcal{T} := \left\{ \bigcup_{A \in \mathcal{V}} A : \mathcal{V} \subseteq \mathcal{U}_{\mathcal{S}} \right\}.$$

We shall show that \mathcal{T} is indeed a topology on X by considering the following proposition:

Proposition 1.1.9 ▶ Finite Intersections of Sets in a Sub-basis Form a Basis

Let \mathcal{S} be a sub-basis for a set X and let $\mathcal{U}_{\mathcal{S}}$ be the set of all finite intersections of sets in \mathcal{S} , then $\mathcal{U}_{\mathcal{S}}$ is a basis of a topology on X .

Proof. Take any $x \in X$. By Definition 1.1.8, we have $x \in \bigcup_{A \in \mathcal{S}} A$. Therefore, there exists some $A \in \mathcal{S} \subseteq \mathcal{P}(X)$ such that $x \in A$. For any $x \in X$ and $B_1, B_2 \in \mathcal{U}_{\mathcal{S}}$ such that $x \in B_1 \cap B_2$, notice that $B_1 \cap B_2$ is a finite intersection of sets in \mathcal{S} , so $B_1 \cap B_2 \in \mathcal{U}_{\mathcal{S}}$. Therefore, by Definition 1.1.2, $\mathcal{U}_{\mathcal{S}}$ is a basis. \square

With Propositions 1.1.9 and 1.1.4, it is clear that \mathcal{T} as constructed above is a topology on X .

1.2 Metric Spaces

Definition 1.2.1 ▶ Metric

A **metric** on a set S is a function $d : S \times S \rightarrow \mathbb{R}$ such that:

- $d(x, y) \geq 0$ for all $x, y \in S$ (positivity);
- $d(x, y) = 0$ if and only if $x = y$ (definiteness);
- $d(x, y) = d(y, x)$ for all $x, y \in S$ (symmetry);
- $d(x, y) \leq d(x, z) + d(y, z)$ for all $x, y, z \in S$ (triangular inequality).

Remark. A metric is sometimes also called a *distance function*.

A metric generalises the notion of distance in Euclidean spaces. We can weaken the above axioms to arrive at the following definition:

Definition 1.2.2 ▶ Pseudo-metric

A **pseudo-metric** on a set S is a function $d : S \times S \rightarrow \mathbb{R}$ such that:

- $d(x, y) \geq 0$ for all $x, y \in S$ (positivity);
- $d(x, x) = 0$ for all $x \in S$;
- $d(x, y) = d(y, x)$ for all $x, y \in S$ (symmetry);
- $d(x, y) \leq d(x, z) + d(y, z)$ for all $x, y, z \in S$ (triangular inequality).

The key difference between a pseudo-metric and a metric is that a pseudo-metric only requires that every element is at 0 distance away from itself, whereas a metric requires that every element is **the only element** that is at 0 distance away from itself.

By dropping the requirement on symmetry, we obtain the following definition:

Definition 1.2.3 ▶ Quasi-metric

A **quasi-metric** on a set S is a function $d : S \times S \rightarrow \mathbb{R}$ such that:

- $d(x, y) \geq 0$ for all $x, y \in S$ (positivity);
- $d(x, y) = 0$ if and only if $x = y$ (definiteness);
- $d(x, y) \leq d(x, z) + d(y, z)$ for all $x, y, z \in S$ (triangular inequality).

We equip a set with a metric to generalise the Euclidean spaces.

Definition 1.2.4 ▶ Metric Space

A **metric space** (S, d) is a set S together with a metric d on S .

The most basic example of a metric is the *discrete metric* defined by

$$d(x, y) = \begin{cases} 1 & \text{if } x \neq y \\ 0 & \text{if } x = y \end{cases}$$

over any set X , which essentially is just a characteristic function.

Recall that in an inner product space (V, g) over some field \mathbb{F} , we can define the length of any $\mathbf{v} \in V$ as

$$\|\mathbf{v}\| = \sqrt{g(\mathbf{v}, \mathbf{v})}.$$

This length function induces a metric over V given by

$$d(\mathbf{x}, \mathbf{y}) = \|\mathbf{x} - \mathbf{y}\|.$$

In the Euclidean space \mathbb{R}^n , a usual definition for distance is

$$d_2(\mathbf{x}, \mathbf{y}) = \left[\sum_{i=1}^n (y_i - x_i)^2 \right]^{\frac{1}{2}}.$$

Note that (\mathbb{R}^n, d_2) is a metric space, where d_2 is known as the *Euclidean distance*. In general, we can prove that for any $p \in \mathbb{N}^+$,

$$d_p(\mathbf{x}, \mathbf{y}) = \left[\sum_{i=1}^n \|y_i - x_i\|^p \right]^{\frac{1}{p}}$$

is a metric over \mathbb{F}^n for any inner product space (\mathbb{F}^n, g) where \mathbb{F} is a field, known as the *L^p -norm*. Furthermore, notice that

$$\max_{i \in \mathbb{N}^+, i \leq n} \|y_i - x_i\|^p \leq \sum_{i=1}^n \|y_i - x_i\|^p \leq n \max_{i \in \mathbb{N}^+, i \leq n} \|y_i - x_i\|^p.$$

Taking the p -th root on all three parts, we have

$$\max_{i \in \mathbb{N}^+, i \leq n} \|y_i - x_i\| \leq \left[\sum_{i=1}^n \|y_i - x_i\|^p \right]^{\frac{1}{p}} \leq n^{\frac{1}{p}} \max_{i \in \mathbb{N}^+, i \leq n} \|y_i - x_i\|.$$

By Squeeze Theorem, this allows us to define

$$d_\infty(\mathbf{x}, \mathbf{y}) = \lim_{p \rightarrow \infty} d_p(\mathbf{x}, \mathbf{y}) = \max_{i \in \mathbb{N}^+, i \leq n} \|y_i - x_i\|.$$

$d_\infty(\mathbf{x}, \mathbf{y})$ can be alternatively written as $\|\mathbf{x} - \mathbf{y}\|_\infty$, which is known as the *infinite norm*.

The p -adic numbers can be defined from the following lemma:

Lemma 1.2.5 ► p -adic Numbers

Let p be any prime number. For all $x \in \mathbb{Q} \setminus \{0\}$, there exists a unique $k \in \mathbb{Z}$ such that

$$x = \frac{p^k r}{s}, \quad r, s \in \mathbb{Z}$$

with $p \nmid r, s$ and $s \neq 0$.

The p -adic norm is defined as

$$|x|_p = \begin{cases} p^{-k} & \text{if } x = \frac{p^k r}{s}, \\ 0 & \text{if } x = 0 \end{cases},$$

which induces a metric over \mathbb{Q} defined by

$$d(x, y) = |x - y|_p.$$

We can show that the p -adic metric satisfies

$$d(x, z) \leq \max\{d(x, y), d(y, z)\}$$

for all $x, y, z \in \mathbb{Q}$. Such a metric is known as an *ultra-metric*.

Given any metric space, the metric will induce a distance between subsets of the space.

Definition 1.2.6 ► Distance between Subsets

Let (X, d) be a metric space and $A, B \subseteq X$ be non-empty. The **distance** between A and B is defined as

$$d(A, B) := \inf\{d(x, y) : (x, y) \in A \times B\}.$$

Additionally, we may wish to define a measure for the size of a subset in a metric space.

Definition 1.2.7 ► Diameter

Let (X, d) be a metric space. The **diameter** of a set $A \subseteq X$ is defined as

$$\text{diam}(A) := \sup\{d(x, y) : (x, y) \in A \times A\}.$$

The set A is **bounded** if $\text{diam}(A)$ is finite.

The name “diameter” is not a coincidence with the diameter of a graph. Specifically, if we consider a graph $G = (V, E)$, the pair (V, d) forms a metric space with $d(u, v)$ being the usual distance between two vertices in G defined as the size of the shortest u - v path in G . It is clear that d is indeed a metric.

Now, let us consider the subgraph $H \subseteq G$ induced by any $U \subseteq V$ and check the eccentricity for H , i.e.,

$$\epsilon(u) = \max\{d_H(u, u') : u' \in U\} \quad \text{for all } u \in U.$$

Now, the diameters for H can be computed as

$$\begin{aligned} \text{diam}(H) &= \max\{\epsilon(u) : u \in U\} \\ &= \sup\{d_H(u, u') : (u, u') \in U \times U\}, \end{aligned}$$

and this obviously agrees with Definition 1.2.7!

Recall that in Definition 1.1.5, we use Euclidean open balls to construct a basis for a topology on \mathbb{R}^n . We can generalise this idea in any metric space.

Proposition 1.2.8 ► Metric Induces a Basis

Let (X, d) be a metric space. Define

$$B_r(x) := \{y \in X : d(x, y) < r\},$$

then collection

$$\mathcal{B}_d := \{B_r(x) : x \in X, r \in \mathbb{R}^+\}$$

is a basis for a topology on X .

Proof. Notice that for any $x \in X$, we have $x \in B_1(x) \in \mathcal{B}_d$. Let $B_p(x_1), B_q(x_2) \in \mathcal{B}_d$ be such that $x \in B_p(x_1) \cap B_q(x_2)$. Take $k = \min\{p - d(x, x_1), q - d(x, x_2)\}$, then clearly $k > 0$ and we can find $B_k(x) \subseteq B_p(x_1) \cap B_q(x_2)$ such that $x \in B_k(x) \in \mathcal{B}_d$. Therefore, \mathcal{B}_d is a basis for a topology on X . \square

Since we can obtain a basis from a metric, it follows naturally that we can generate a topology using this induced basis.

Definition 1.2.9 ► Metrisable Topology

Let (X, d) be a metric space. A topology \mathcal{T} on X is **metrisable**, or **induced** by d , if it is generated by \mathcal{B}_d

We can verify that the discrete topology $\mathcal{P}(X)$ is induced by the discrete metric. Let the discrete metric on X be χ , then it is easy to see that

$$B_r(x) = \begin{cases} \{x\} & \text{if } 0 < r \leq 1 \\ X & \text{if } r > 1 \end{cases}.$$

Therefore,

$$\mathcal{B}_\chi = \{X\} \cup \{\{x\} : x \in X\}.$$

Let \mathcal{T}_χ be the topology on X generated by \mathcal{B}_χ , then it suffices to prove that $\mathcal{P}(X) \subseteq \mathcal{T}_\chi$. Take any $U \in \mathcal{P}(X)$, then for any $u \in U$, we have $u \in \{u\} \subseteq U$. Clearly $\{u\} \in \mathcal{B}_\chi$, so $\mathcal{T}_\chi = \mathcal{P}(X)$ is the discrete topology indeed.

In particular, for Euclidean spaces, the following result extends Definition 1.1.5:

Proposition 1.2.10 ▶ Every L^p -metric Generates the Standard Topology

Let \mathcal{T} be the standard topology on \mathbb{R}^n , then \mathcal{T} is induced by any L^p -metric d_p .

Proof. For any $p \in \mathbb{N}^+$, notice that

$$\max_{i \in \mathbb{N}^+, i \leq n} \|y_i - x_i\|^p \leq \sum_{i=1}^n \|y_i - x_i\|^p \leq n \max_{i \in \mathbb{N}^+, i \leq n} \|y_i - x_i\|^p.$$

Taking the p -th root yields

$$\max_{i \in \mathbb{N}^+, i \leq n} \|y_i - x_i\| \leq \left[\sum_{i=1}^n \|y_i - x_i\|^p \right]^{\frac{1}{p}} \leq n^{\frac{1}{p}} \max_{i \in \mathbb{N}^+, i \leq n} \|y_i - x_i\|.$$

This means that

$$d_\infty(\mathbf{x}, \mathbf{y}) \leq d_p(\mathbf{x}, \mathbf{y}) \leq n^{\frac{1}{p}} d_\infty(\mathbf{x}, \mathbf{y}).$$

Let \mathcal{T}_0 and \mathcal{T}_p be topologies on \mathbb{R}^n generated by \mathcal{B}_{d_∞} and \mathcal{B}_{d_p} respectively. Take any $T \in \mathcal{T}_p$, then for any $\mathbf{t} \in T$, there is some $B_r(\mathbf{t}') \in \mathcal{B}_{d_p}$ such that $\mathbf{t} \in B_r(\mathbf{t}') \subseteq T$. Take some $\ell = \frac{1}{2}|r - d_p(\mathbf{t}, \mathbf{t}')|$, then we have found $B_\ell(\mathbf{t}) \in \mathcal{B}_{d_p}$ such that

$$\mathbf{t} \in B_\ell(\mathbf{t}) \subseteq B_r(\mathbf{t}') \subseteq T.$$

Take $k = \frac{1}{2}\ell n^{-\frac{1}{p}}$ and consider

$$B_k(\mathbf{t}) := \{\mathbf{y} \in \mathbb{R}^n : d_\infty(\mathbf{t}, \mathbf{y}) < k\} \in \mathcal{B}_{d_\infty}.$$

Notice that for each $\mathbf{y} \in B_k(\mathbf{t})$, we have

$$d_p(\mathbf{t}, \mathbf{y}) \leq n^{\frac{1}{p}} d_\infty(\mathbf{t}, \mathbf{y}) < \ell,$$

so $\mathbf{t} \in B_k(\mathbf{t}) \subseteq B_\ell(\mathbf{t}) \subseteq T$. This implies that $T \in \mathcal{T}_0$ and so $\mathcal{T}_p \subseteq \mathcal{T}_0$. By a similar argument, one may check that $\mathcal{T}_0 \subseteq \mathcal{T}_p$. Therefore, $\mathcal{T}_0 = \mathcal{T}_p$ for any $p \in \mathbb{N}^+$. Note that by Definition 1.1.5, \mathcal{T} is generated by \mathcal{B}_{d_2} , which means that $\mathcal{T} = \mathcal{T}_2 = \mathcal{T}_0 = \mathcal{T}_p$ for any $p \in \mathbb{N}^+$. Therefore, \mathcal{T} is induced by any L^p -metric d_p . \square

The fact that

$$d_\infty(\mathbf{x}, \mathbf{y}) \leq d_p(\mathbf{x}, \mathbf{y}) \leq n^{\frac{1}{p}} d_\infty(\mathbf{x}, \mathbf{y})$$

means that all L^p -metrics are equivalent over the same space.

1.3 Subspace Topologies

Definition 1.3.1 ► Subspace Topology

Let (Y, \mathcal{T}_Y) be a topological space and $X \subseteq Y$ be some subset. The collection

$$\mathcal{T}_X := \{U \cap X : U \in \mathcal{T}_Y\}$$

is the **subspace topology** on X .

We may check that \mathcal{T}_X defined as such is indeed a topology on X . First, by taking $U = \emptyset$ and $U = Y$ respectively, we know that $\emptyset, X \in \mathcal{T}_X$. For any $U \in \mathcal{T}_Y$, we have $Y \setminus U \in \mathcal{T}_Y$ and so

$$X \setminus (U \cap X) = (Y \setminus U) \cap X \in \mathcal{T}_X.$$

For any $\mathcal{V} \subseteq \mathcal{T}_X$, we define a subset $\mathcal{U}_{\mathcal{V}} \subseteq \mathcal{T}_Y$ such that for each $V \in \mathcal{V}$ there is a unique $U_V \in \mathcal{U}_{\mathcal{V}}$ such that $V = U_V \cap X$. Then,

$$\begin{aligned} \bigcup_{A \in \mathcal{V}} A &= \bigcup_{B \in \mathcal{U}_{\mathcal{V}}} (B \cap X) \\ &= \left(\bigcup_{B \in \mathcal{U}_{\mathcal{V}}} B \right) \cap X \\ &\in \mathcal{T}_X. \end{aligned}$$

Let $X_1, X_2, \dots, X_n \in \mathcal{T}_X$ and define $X_i = U_i \cap X$ where $U_i \in \mathcal{T}_Y$ for $i = 1, 2, \dots, n$, then

$$\begin{aligned} \bigcap_{i=1}^n X_i &= \bigcap_{i=1}^n (U_i \cap X) \\ &= \left(\bigcap_{i=1}^n U_i \right) \cap X \\ &\in \mathcal{T}_X. \end{aligned}$$

So \mathcal{T}_X is really a topology on X . Intuitively, the following holds:

Proposition 1.3.2 ► Basis for a Subspace

Let (Y, \mathcal{T}_Y) be a topological space and \mathcal{T}_X be the subspace topology on some $X \subseteq Y$. If \mathcal{B}_Y is a basis of \mathcal{T}_Y , then

$$\mathcal{B}_X := \{B \cap X : B \in \mathcal{B}_Y\}$$

is a basis of \mathcal{T}_X .

Proof. We first prove that \mathcal{B}_X is a basis. Take any $x \in X \subseteq Y$. Note that there exists some $B \in \mathcal{B}_Y$ such that $x \in B$. Take $B \cap X \in \mathcal{B}_X$, then $x \in B \cap X$. For any $B_1, B_2 \in \mathcal{B}_X$ with $x \in B_1 \cap B_2$, we write $B_1 := B'_1 \cap X$ and $B_2 := B'_2 \cap X$ where $B'_1, B'_2 \in \mathcal{B}_Y$, then we have $x \in B'_1 \cap B'_2$. This means that there is some $B \in \mathcal{B}_Y$ such that $x \in B \subseteq B'_1 \cap B'_2$. Write $B' := B \cap X \in \mathcal{B}_X$, then for each $b \in B'$, we know that $b \in B'_1 \cap B'_2$ and $b \in X$, which implies that $b \in B_1 \cap B_2$. Therefore, $x \in B' \subseteq B_1 \cap B_2$. This means that \mathcal{B}_X is a basis of a topology on X .

We then prove that \mathcal{T}_X is generated by \mathcal{B}_X . Let \mathcal{T} be the topology generated by \mathcal{B}_X . By Proposition 1.1.4, we have

$$\mathcal{T} = \left\{ \bigcup_{A \in \mathcal{V}} A : \mathcal{V} \subseteq \mathcal{B}_X \right\}.$$

Similarly, we can write

$$\mathcal{T}_Y = \left\{ \bigcup_{A \in \mathcal{V}} A : \mathcal{V} \subseteq \mathcal{B}_Y \right\}.$$

Take any $T \in \mathcal{T}_X$, then there exists some $\mathcal{V} \subseteq \mathcal{B}_Y$ such that

$$\begin{aligned} T &= \left(\bigcup_{A \in \mathcal{V}} A \right) \cap X \\ &= \bigcup_{A \in \mathcal{V}} A \cap X \\ &\in \mathcal{T}. \end{aligned}$$

Therefore, $\mathcal{T}_X \subseteq \mathcal{T}$. Conversely, take any $T' \in \mathcal{T}$, there exists some $\mathcal{U} \subseteq \mathcal{B}_Y$ such that

$$\begin{aligned} T' &= \bigcup_{B \in \mathcal{U}} (B \cap X) \\ &= \left(\bigcup_{B \in \mathcal{U}} B \right) \cap X \\ &\in \mathcal{T}_X. \end{aligned}$$

Therefore, $\mathcal{T} \subseteq \mathcal{T}_X$ and so $\mathcal{T}_X = \mathcal{T}$. □

The following result shows that open sets in subspaces remain open in the superspace:

Proposition 1.3.3 ▶ Superspace Preserve Open Sets

Let (Y, \mathcal{T}_Y) be a topological space. If $X \subseteq Y$ is open in Y and $U \subseteq X$ is open in X , then U is open in Y .

Proof. Let \mathcal{T}_X be the subspace topology on X . Since U is open in X , we have $U \in \mathcal{T}_X$. By Definition 1.3.1, there exists some $V \in \mathcal{T}_Y$ such that $U = V \cap X$. However, $U \subseteq X$, so $U = V \in \mathcal{T}_Y$, which means that U is open in Y . \square

We can do a similar manipulation with metric spaces and induce a metric on a subspace.

Definition 1.3.4 ▶ Subspace Metric

Let (X, d) be a metric space. The **subspace metric** of some $A \subseteq X$ is the restriction of d to A , denoted as

$$d_A(x, y) = d(x, y), \quad \text{for all } x, y \in A.$$

Naturally, the following result is true:

Proposition 1.3.5 ▶ Subspace Metric Induces Subspace Topology

Let (X, d) be a metric space. The topology induced by the subspace metric d_A on some subspace $A \subseteq X$ is the subspace topology on A .

Proof. Let \mathcal{T}_d and \mathcal{T}_{d_A} be topologies induced by d on X with basis \mathcal{B}_d and by d_A on A with basis \mathcal{B}_{d_A} respectively. Let \mathcal{T}_A be the subspace topology on A with basis \mathcal{B}_A . Take any $B_A \in \mathcal{B}_A$, then there exists $B_r(x) \in \mathcal{B}_d$ such that $B_A = B_r(x) \cap A$. For any $y \in B_A$, consider the ball

$$B_{r'}(y) := \{z \in A : d_A(z, y) < r'\} \in \mathcal{B}_{d_A}.$$

Note that $y \in B_{r'}(y)$, so by Proposition 1.1.7, we have $\mathcal{T}_A \subseteq \mathcal{T}_{d_A}$. Conversely, for any $B_r(x) \in \mathcal{B}_{d_A}$, there exists some $B_{r'}(x) \in \mathcal{B}_d$ such that $B_r(x) \subseteq B_{r'}(x)$. Notice that $B_r(x) \subseteq A$, so for any $y \in B_r(x)$, we have $y \in B_{r'}(x) \cap A \in \mathcal{B}_A$. Therefore, by Proposition 1.1.7, $\mathcal{T}_{d_A} \subseteq \mathcal{T}_A$ and so $\mathcal{T}_{d_A} = \mathcal{T}_A$. \square

1.4 Closed Sets

Definition 1.4.1 ▶ Closed Set

Let (X, \mathcal{T}) be a topological space. A subset $A \subseteq X$ is **closed** if $X \setminus A \in \mathcal{T}$.

A set might be open and closed simultaneously. For example, every set X is both open and

closed in itself.

Proposition 1.4.2 ▶ Arbitrary Intersection and Finite Union of Closed Sets Are Closed

Let (X, \mathcal{T}) be a topological space, then

1. if $\mathcal{G} := \{G_\alpha : \alpha \in I\}$ is a family of closed set in X with respect to some index set I , then $\bigcap_{\alpha \in I} G_\alpha$ is closed in X ;
2. if G_1, G_2, \dots, G_n are closed in X , then $\bigcup_{i=1}^n G_i$ is closed in X .

Proof. Notice that

$$X \setminus \bigcap_{\alpha \in I} G_\alpha = \bigcup_{\alpha \in I} X \setminus G_\alpha.$$

Since $X \setminus G_\alpha$ is open in X for all $\alpha \in I$, this means that $X \setminus \bigcap_{\alpha \in I} G_\alpha$ is open in X , and so $\bigcap_{\alpha \in I} G_\alpha$ is closed in X . Notice also that

$$X \setminus \bigcup_{i=1}^n G_i = \bigcap_{i=1}^n X \setminus G_i.$$

By a similar argument $\bigcup_{i=1}^n G_i$ is closed in X . □

The following proposition justifies the fact that intersecting a closed set with a subspace produces a closed set in that subspace:

Proposition 1.4.3 ▶ Closed Sets in Subspace Topology

Let $Y \subseteq X$, then $A \subseteq Y$ is closed in Y if and only if there exists some closed set $G \subseteq X$ such that $A = G \cap Y$.

Proof. Suppose that A is closed in Y , then $Y \setminus A$ is open in Y . Therefore, there exists some open set $B \subseteq X$ such that $Y \setminus A = B \cap Y$. Take $G := X \setminus B$, then

$$G \cap Y = A.$$

Suppose conversely that there exists some closed set $G \subseteq X$ such that $A = G \cap Y$. Consider

$$Y \setminus (G \cap Y) = (X \setminus G) \cap Y.$$

Notice that $X \setminus G$ is open in X , so $Y \cap A$ is open in Y , i.e., A is closed in Y . □

The following result is analogous to Proposition 1.3.3:

Proposition 1.4.4 ▶ Superspace Preserves Closed Sets

If $Y \subseteq X$ is closed in X and $A \subseteq Y$ is closed in Y , then A is closed in X .

Proof. Consider $X \setminus A = X \setminus Y \cup Y \setminus A$. Since Y is closed in X , this means that $X \setminus Y$ is open in X . Note also that $Y \setminus A$ is open in Y . By Proposition 1.3.3, $Y \setminus A$ is open in X . Therefore, $X \setminus A$ is open in X and so A is closed in X . \square

Closed sets help define the notion “interior of a set”.

Definition 1.4.5 ▶ Interior, Closure and Boundary

Let (X, \mathcal{T}) be a topological space and $A \subseteq X$. The **interior** of A is

$$\overset{\circ}{A} := \bigcup_{\substack{U \in \mathcal{T} \\ U \subseteq A}} A \cap U.$$

The **closure** of A is

$$\bar{A} := \bigcap_{\substack{X \setminus G \in \mathcal{T} \\ A \subseteq G}} G.$$

The **boundary** of A is

$$\partial A = \bar{A} \setminus \overset{\circ}{A}.$$

We interpret the above definition as follows: $\overset{\circ}{A}$ is the union of all open sets contained by A . Moreover, \bar{A} is the smallest closed set in X which contains A . To see this, let $C \subseteq X$ be any closed set in X containing A . Take any $a \in \bar{A}$, then since a is contained by all closed sets containing A , it is clear that $a \in C$, which implies that $\bar{A} \subseteq C$.

Remark.

1. $\overset{\circ}{A} \subseteq A \subseteq \bar{A}$.
2. $\overset{\circ}{A} = A$ if and only if A is open in X .
3. $\bar{A} = A$ if and only if A is closed in X .

We would like to discuss the properties of closure. The following definition is useful:

Definition 1.4.6 ▶ Limit Point

Let (X, \mathcal{T}) be a topological space. For any $A \subseteq X$, a point $x \in X$ is a **limit point** of A if for every open set $U \subseteq X$ containing x ,

$$(A \setminus \{x\}) \cap U \neq \emptyset.$$

Now, we propose two properties for the closure:

Proposition 1.4.7 ► Properties of Closure

Let (X, \mathcal{T}) be a topological space. For any $A \subseteq X$,

1. $x \in \bar{A}$ if and only if for any open set $U \subseteq X$ containing x , $U \cap A \neq \emptyset$;
2. if A' is the set of limit points of A , then $\bar{A} = A \cup A'$.

Proof. We will prove the first statement by considering the contrapositive, i.e., we prove that $x \in X \setminus \bar{A}$ if and only if there exists some open set $U \subseteq X$ containing x such that $U \cap A = \emptyset$. The “if” direction is trivial because $X \setminus \bar{A}$ is open in X such that $(X \setminus \bar{A}) \cap A = \emptyset$. Take $U \subseteq X$ to be an open set in X with $x \in U$ and $U \cap A = \emptyset$. This means that $x \notin A \subseteq \bar{A}$. Therefore, $x \in X \setminus \bar{A}$.

Take any $a \in A'$, then for every open set $U \subseteq X$ with $a \in U$, we have

$$U \cap A \supseteq U \cap (A \setminus \{a\}) \neq \emptyset.$$

Therefore, $A \cup A' \subseteq \bar{A}$. Take any $x \in \bar{A}$, we shall prove that if $x \notin A'$, then $x \in A$. Since x is not a limit point of A , there exists some open set $V \subseteq X$ containing x such that $(A \setminus \{x\}) \cap V = \emptyset$. However, $x \in \bar{A}$ implies that $V \cap A \neq \emptyset$, so $x \in A$. \square

The notion of limit points also leads to the definition of convergence. Before that, we shall define the notion of *neighbourhood*.

Definition 1.4.8 ► Neighbourhood

Let (X, \mathcal{T}) be a topological space. An open set $U \subseteq X$ is called a **neighbourhood** of some $x \in X$ if $x \in U$.

Intuitively, we think of the statement $x_i \rightarrow x$ as the fact that no matter how small a neighbourhood we choose for x , there is always a consecutive infinite subsequence of the x_i 's which falls in this neighbourhood.

Definition 1.4.9 ► Convergence

A sequence $\{x_i\}_{i=1}^{\infty}$ of points in a topological space (X, \mathcal{T}) **converges** to $x \in X$ if for any neighbourhood $U \subseteq X$ containing x , there exists some $N \in \mathbb{N}^+$ such that $x_k \in U$ for all $k > N$, denoted as $x_i \rightarrow x$. x is said to be the **limit** of $\{x_i\}_{i=1}^{\infty}$.

It is important to distinguish between limit and limit points. For example, consider the constant sequence $\{1\}_{i=1}^{\infty}$. Clearly, $x_i \rightarrow 1$ but one may check that 1 is not a limit point for this sequence.

In a metric space, we can make use of the metric to describe convergence in a more quan-

titative way.

Theorem 1.4.10 ► Convergence in Metric Spaces

Let (X, d) be a metric space. A sequence $\{x_i\}_{i=1}^{\infty}$ in X converges to x if and only if for every $\epsilon > 0$, there exists some $N \in \mathbb{N}^+$ such that $d(x_i, x) < \epsilon$ for all $i > N$.

Proof. Suppose that $x_i \rightarrow x$ as $i \rightarrow \infty$. For all $\epsilon > 0$, take the open ball $B_{\epsilon}(x) \subseteq X$. Clearly, $B_{\epsilon}(x)$ is a neighbourhood of x . By Definition 1.4.9, there exists some $N \in \mathbb{N}^+$ such that $x_i \in B_{\epsilon}(x)$ for all $i > N$, i.e., $d(x_i, x) < \epsilon$ for all $i > N$. Conversely, suppose that for every $\epsilon > 0$, there exists some $N \in \mathbb{N}^+$ such that $d(x_i, x) < \epsilon$ for all $i > N$. Let $U \subseteq X$ be any neighbourhood containing x . Note that U is open in X , so by Theorem 1.1.4, there exists some open ball $B_r(x) \subseteq U$ such that $x \in B_r(x)$. Therefore, there exists some $M \in \mathbb{N}^+$ such that $d(x_i, x) < r$, i.e., $x_i \in B_r(x) \subseteq U$, for all $i > M$. Therefore, $x_i \rightarrow x$. \square

1.5 Continuity

Definition 1.5.1 ► Continuous Map

Let X and Y be topological spaces. A map $f : X \rightarrow Y$ is **continuous** if for any open set $U \subseteq Y$, the pre-image $f^{-1}(U)$ is open in X .

Suppose \mathcal{T}_X and \mathcal{T}_Y are topologies on X and Y respectively. The above definition basically says that for all $U \in \mathcal{T}_Y$, we have $f^{-1}(U) \in \mathcal{T}_X$. The following proposition gives an equivalent definition for continuity in terms of sub-bases.

Proposition 1.5.2 ► Equivalent Definition of Continuity

If \mathcal{S} is a sub-basis for a topology on some set Y , then for any topological space X , a map $f : X \rightarrow Y$ is continuous if and only if $f^{-1}(S)$ is open in X for any $S \in \mathcal{S}$.

Proof. Suppose that f is continuous. Note that any $S \in \mathcal{S}$ is open in Y , so by Definition 1.5.1, $f^{-1}(S)$ is open in X . Suppose conversely that $f^{-1}(S)$ is open in X for any $S \in \mathcal{S}$. Take any open set $U \subseteq Y$. By Propositions 1.3.2 and 1.1.4, there exists finite subsets $\mathcal{U}_i \subseteq \mathcal{P}(\mathcal{S})$ where $i \in I$ for some index set I such that

$$U = \bigcup_{i \in I} \left(\bigcap_{S \in \mathcal{U}_i} S \right).$$

Therefore,

$$f^{-1}(U) = \bigcup_{i \in I} \left(\bigcap_{S \in \mathcal{U}_i} f^{-1}(S) \right),$$

which is clearly open in X . Therefore, f is continuous. \square

A trivial example for continuous maps is the *constant map* $f : X \rightarrow Y$ such that $f(x) = y_0$ for some fixed $y_0 \in Y$. This is simply because

$$f^{-1}(U) = \begin{cases} X & \text{if } y_0 \in U \\ \emptyset & \text{otherwise} \end{cases}.$$

The following result should be very intuitive:

Proposition 1.5.3 ► Composition Preserves Continuity

Let X, Y, Z be topological spaces. If $f : X \rightarrow Y$ and $g : Y \rightarrow Z$ are continuous maps, then $g \circ f$ is continuous.

It is also clear that for any topological space X , the *inclusion map* $f : A \rightarrow X$ for any $A \subseteq X$ such that $f(a) = a$ is continuous. Analogously, if $f : X \rightarrow Y$ is continuous, then the restriction $f|_A : A \rightarrow Y$ for any subspace $A \subseteq X$ is also continuous.

Proposition 1.5.4 ► Properties of Continuous Maps

Let X and Y be topological spaces. For any map $f : X \rightarrow Y$, the followings are equivalent:

1. f is continuous;
2. for all $A \subseteq X$, $f(\overline{A}) \subseteq \overline{f(A)}$;
3. for any closed set $B \subseteq Y$, $f^{-1}(B)$ is closed in X ;
4. for any $x \in X$ and any open set $V \subseteq Y$ with $f(x) \in V$, there exists an open set $U \subseteq X$ such that $x \in U$ and $f(U) \subseteq V$.

Proof. Suppose that f is continuous. Note that $f(A) \subseteq \overline{f(A)}$, so $A \subseteq f^{-1}(\overline{f(A)})$. Since $\overline{f(A)}$ is closed in Y , so by Definition 1.5.1,

$$f^{-1}(Y \setminus \overline{f(A)}) = X \setminus f^{-1}(\overline{f(A)})$$

is open in X . Therefore, $f^{-1}(\overline{f(A)})$ is closed in X . By Proposition 1.4.7, $\overline{A} = A \cup A'$

where A' is the set of limit points of A . We claim that $A' \subseteq f^{-1}(\overline{f(A)})$. Suppose on contrary that there exists some $a \in A' \setminus f^{-1}(\overline{f(A)})$. Since $X \setminus f^{-1}(\overline{f(A)})$ is open, by Definition 1.4.6,

$$(A \setminus \{a\}) \cap \left(X \setminus f^{-1}(\overline{f(A)}) \right) \neq \emptyset,$$

which is a contradiction because $A \setminus \{a\} \subseteq f^{-1}(\overline{f(A)})$. Therefore, $\bar{A} \subseteq f^{-1}(\overline{f(A)})$, which means that $f(\bar{A}) \subseteq \overline{f(A)}$.

Suppose that $f(\bar{A}) \subseteq \overline{f(A)}$ for any $A \subseteq X$. For any closed set $B \subseteq Y$, we have $B = \bar{B}$. Notice that

$$f(\overline{f^{-1}(B)}) \subseteq \overline{f(f^{-1}(B))} = B = f(f^{-1}(B)),$$

so $\overline{f^{-1}(B)} \subseteq f^{-1}(B)$. This implies that $\overline{f^{-1}(B)} \subseteq f^{-1}(B)$, and so $f^{-1}(B)$ is closed in X .

Suppose that $f^{-1}(B)$ is closed in X for any closed set $B \subseteq Y$. Take any $x \in X$ and any open set $V \subseteq Y$ with $f(x) \in V$. Since $Y \setminus V$ is closed in Y , $f^{-1}(Y \setminus V) = X \setminus f^{-1}(V)$ is closed in X . Therefore, $f^{-1}(V)$ is open in X . It is clear that $x \in f^{-1}(V)$ and $f(f^{-1}(V)) \subseteq V$. □

Next, we introduce a lemma which specifies a methodology to construct a continuous map from two different continuous maps.

Lemma 1.5.5 ► Pasting Lemma

Let X and Y be topological spaces such that $X = A \cup B$ for some closed sets A and B . If $f : A \rightarrow Y$ and $g : B \rightarrow Y$ are continuous and $f(x) = g(x)$ for all $x \in A \cap B$, then the function $h : X \rightarrow Y$ defined by

$$h(x) = \begin{cases} f(x) & \text{if } x \in A \\ g(x) & \text{if } x \in B \end{cases}.$$

Proof. Let $U \subseteq Y$ be any open set. Then it is clear that $h^{-1}(U) = f^{-1}(U) \cup g^{-1}(U)$. Since f and g are continuous, both $f^{-1}(U)$ and $g^{-1}(U)$ are open in X , so it follows that $h^{-1}(U)$ is open in X . Therefore, h is continuous. □

Observe that the continuity of a function $f : X \rightarrow Y$ actually depends on our choice of topologies on X and Y . On the other hand, this also means that every function f could

induce a topology on X such that it is continuous.

Definition 1.5.6 ► Pull-Back Topology

Let \mathcal{T}_Y be a topology on Y and let $f : X \rightarrow Y$. The **pull-back topology** on X is defined as

$$\mathcal{T}_X := \{f^{-1}(U) : U \in \mathcal{T}_Y\}.$$

Note that the pull-back topology is the coarsest topology on X such that f is a continuous map. To verify this, let \mathcal{T} be any topology on X such that f is continuous. Take any $T \in \mathcal{T}_X$, then there exists some $U \in \mathcal{T}_Y$ such that $T = f^{-1}(U)$. However, this means that $T \in \mathcal{T}$ since f is continuous with respect to \mathcal{T} . This shows that $\mathcal{T}_X \subseteq \mathcal{T}$.

Definition 1.5.7 ► Uniform Continuity

Let (X, d_X) and (Y, d_Y) be metric spaces. A function $f : X \rightarrow Y$ is **uniformly continuous** on X if for all $\epsilon > 0$, there exists some $\delta > 0$ such that $d_Y(f(x), f(y)) < \epsilon$ whenever $d_X(x, y) < \delta$.

Essentially, uniform continuity describes a phenomenon where the choice of δ is irrelevant to the point in the function's domain.

We wish to use the following proposition to characterise all uniformly continuous functions:

Proposition 1.5.8 ► Uniform Continuity Characterisation

Let (X, d_X) and (Y, d_Y) be metric spaces. A function $f : X \rightarrow Y$ is uniformly continuous if and only if for any sequences $\{x_i\}_i^\infty$ and $\{y_i\}_i^\infty$ in X such that $\lim_{i \rightarrow \infty} d_X(x_i, y_i) = 0$, we have $\lim_{i \rightarrow \infty} d_Y(f(x_i), f(y_i)) = 0$.

Proof. It suffices to prove the “if” direction only because the other direction is trivial from Definition 1.5.7. We shall consider the contrapositive statement. Suppose that there exist sequences $\{x_i\}_i^\infty$ and $\{y_i\}_i^\infty$ with $\lim_{i \rightarrow \infty} d_X(x_i, y_i) = 0$ such that $\lim_{i \rightarrow \infty} d_Y(f(x_i), f(y_i)) \neq 0$, then for all $\delta > 0$, there exists some $N \in \mathbb{N}^+$ such that $d_X(x_i, y_i) < \delta$ for all $i > N$. However, notice that there exists some $\epsilon > 0$ such that for all $M \in \mathbb{N}^+$, there exists some $m > M$ with $d_Y(f(x_m), f(y_m)) \geq \epsilon$. This means that for any $\epsilon > 0$, we can find some k such that for all $\delta > 0$, we have $d_X(x_k, y_k) < \delta$ but $d_Y(f(x_k), f(y_k)) \geq \epsilon$. By Definition 1.5.7, this implies that f is not uniformly continuous. \square

Recall that previously, we have defined convergence for sequences. In particular, we can consider a sequence of functions. Note that, if we say that $\{f_n\}_{n=1}^\infty$ converges to some func-

tion f , it might have two different interpretations. First, it might be the case where for any fixed x , we have $f_n(x)$ converging to $f(x)$; second it is also possible that the values of f_n and f becomes infinitesimally close when n is large over all possible x . We will formalise this distinction as follows:

Definition 1.5.9 ► Point-wise and Uniform Convergence

Let $\{f_n\}_{n=1}^{\infty}$ be a sequence of maps from X to a metric space (Y, d) . We say that $\{f_n\}_{n=1}^{\infty}$ **converges point-wisely** to $f : X \rightarrow Y$ if for any $x \in X$, $\lim_{n \rightarrow \infty} f_n(x) = f(x)$, and that $\{f_n\}_{n=1}^{\infty}$ **converges uniformly** to $f : X \rightarrow Y$ if for any $\epsilon > 0$, there exists some $N \in \mathbb{N}^+$ such that for all $n \geq N$ and any $x \in X$, $d(f_n(x), f(x)) < \epsilon$.

The following proposition gives a test for continuity using convergence of functional sequences:

Proposition 1.5.10 ► Uniform Convergence Implies Continuity

Let $\{f_n\}_{n=1}^{\infty}$ be a sequence of maps from a metric space (X, d_X) to a metric space (Y, d_Y) . If $\{f_n\}_{n=1}^{\infty}$ converges uniformly to $f : X \rightarrow Y$, then f is continuous.

Proof. Since $\{f_n\}_{n=1}^{\infty}$ converges uniformly to f , for any $x \in X$ and any $\epsilon > 0$, there exists some $N \in \mathbb{N}^+$ such that $d_Y(f_n(x), f(x)) < \frac{\epsilon}{3}$ for all $n > N$. Since f_n is continuous, for each $x_0 \in X$ there exists some $\delta > 0$ such that $d_Y(f_n(x_0), f_n(x)) < \frac{\epsilon}{3}$ whenever $d_X(x_0, x) < \delta$. Notice that for all $x \in X$ such that $d_X(x_0, x) < \delta$, we have

$$\begin{aligned} d_Y(f(x_0), f(x)) &\leq d_Y(f(x_0), f_n(x_0)) + d_Y(f_n(x_0), f_n(x)) + d_Y(f_n(x), f(x)) \\ &< \epsilon. \end{aligned}$$

Therefore, f is continuous on X . □

In other words, a function is continuous if there exists some sequence of continuous functions which converges to it uniformly.

1.6 Product Space

Since topological spaces are essentially sets, we can consider the product of multiple spaces.

Definition 1.6.1 ▶ Projection

Let $\{X_\alpha\}_{\alpha \in \Lambda}$ be a sequence of non-empty sets, consider the product space $\prod_{\alpha \in \Lambda} X_\alpha$. The **projection** on the β -th factor is

$$\pi_{X_\beta} : \prod_{\alpha \in \Lambda} X_\alpha \rightarrow X_\beta$$

such that $\pi_{X_\beta}(x) = x_\beta$.

Observe that essentially, the projection maps a vector in the product space to some element in the space representing the β -th dimension.

Note that for any $\beta \in \Lambda$ and any $U \subseteq X_\beta$, we have

$$\pi_{X_\beta}^{-1}(U) = \left\{ x \in \prod_{\alpha \in \Lambda} X_\alpha : x_\beta \in U \right\}.$$

In other words, the pre-image of projection for some set U is the set of all vectors in the product space whose β -th component is in U .

Definition 1.6.2 ▶ Product Topology

Let $\{(X_\alpha, \mathcal{T}_\alpha)\}_{\alpha \in \Lambda}$ be a sequence of non-empty topological spaces. The **product topology** is the topology generated by the sub-basis

$$\mathcal{S} := \left\{ \pi_{X_\alpha}^{-1}(U_\alpha) : \alpha \in \Lambda, U_\alpha \in \mathcal{T}_\alpha \right\}.$$

Intuitively, the product topology is formed by all vectors whose every component is contained in some open set in one of the topological spaces. This might seem similar to collecting all products formed taking one arbitrary open set from each space and multiplying them together.

Definition 1.6.3 ▶ Box Topology

Let $\{(X_\alpha, \mathcal{T}_\alpha)\}_{\alpha \in \Lambda}$ be a sequence of non-empty topological spaces. The **box topology** is the topology generated by the basis

$$\mathcal{B} := \left\{ \prod_{\alpha \in \Lambda} U_\alpha : U_\alpha \in \mathcal{T}_\alpha \right\}.$$

Remark. For finite product spaces, the product topology and the box topology are the same. However, they are different if the product is infinite.

We may check that the set \mathcal{B} in Definition 1.6.3 is indeed a basis. Take any $\mathbf{x} \in \prod_{\alpha \in \Lambda} X_\alpha$, then for each $\alpha \in \Lambda$, there exists some $U_\alpha \in \mathcal{T}_\alpha$ such that $x_\alpha \in U_\alpha$, which implies that

$$\mathbf{x} \in \prod_{\alpha \in \Lambda} U_\alpha.$$

If $V := \prod_{\alpha \in \Lambda} U_\alpha$ and $U := \prod_{\alpha \in \Lambda} V_\alpha$ are such that $\mathbf{x} \in U \cap V$, then $x_\alpha \in U_\alpha \cap V_\alpha$ for each $\alpha \in \Lambda$. Clearly, $U_\alpha \cap V_\alpha \in \mathcal{T}_\alpha$, so we can take $W := \prod_{\alpha \in \Lambda} U_\alpha \cap V_\alpha$ such that

$$\mathbf{x} \in W \subseteq V \cap U.$$

We now make a claim that the projection from product topology is always continuous.

Proposition 1.6.4 ► Product Topology Guarantees Continuous Projection

Let $\{(X_\alpha, \mathcal{T}_\alpha)\}_{\alpha \in \Lambda}$ be a sequence of non-empty topological spaces. The product topology on $\prod_{\alpha \in \Lambda} X_\alpha$ is the coarsest topology such that π_{X_α} is continuous for all $\alpha \in \Lambda$.

Proof. Let \mathcal{S} be the sub-basis generating the product topology and let $U \subseteq X_\alpha$ be open, then $\pi_{X_\alpha}^{-1}(U) \in \mathcal{S}$ and therefore is open. Therefore, π_{X_α} is continuous with respect to the product topology.

Let \mathcal{T} be any topology on $\prod_{\alpha \in \Lambda} X_\alpha$ such that π_{X_α} is continuous, then for any open set $U \in \mathcal{T}$, the pre-image $\pi_{X_\alpha}^{-1}(U) \in \mathcal{S}$ must be open, which implies that $\mathcal{S} \subseteq \mathcal{T}$. Notice that this is equivalent to \mathcal{T} containing

$$\mathcal{B} := \left\{ \bigcap_{\alpha \in \Lambda'} \pi_{X_\alpha}^{-1}(U_\alpha) : \Lambda' \subseteq \Lambda \text{ is finite, } U_\alpha \in \mathcal{T}_\alpha \right\}.$$

However, \mathcal{B} generates the product topology, which is the coarsest topology containing \mathcal{B} , so \mathcal{T} must be finer than the product topology. \square

Analogously, we can construct continuous functions over the product space using continuous functions defined on each of the individual spaces.

Proposition 1.6.5 ► Continuous of Functions over Product Spaces

Let $\{(X_\alpha, \mathcal{T}_\alpha)\}_{\alpha \in \Lambda}$ be a sequence of non-empty topological spaces and let Y be a topological space. For any $\alpha \in \Lambda$, define $f_\alpha : Y \rightarrow X_\alpha$, then $f : Y \rightarrow \prod_{\alpha \in \Lambda} X_\alpha$ defined by

$$f(y) = (f_\alpha(y))_{\alpha \in \Lambda}$$

is continuous if and only if f_α is continuous for all $\alpha \in \Lambda$.

Proof. Suppose that f is continuous. Notice that for all $\alpha \in \Lambda$,

$$f_\alpha(y) = \pi_{X_\alpha}(f(y))$$

for all $y \in Y$. Therefore, $f_\alpha = \pi_{X_\alpha} \circ f$. By Proposition 1.6.4, π_{X_α} is continuous, and so f_α is continuous for all $\alpha \in \Lambda$.

Conversely, suppose that f_α is continuous for all $\alpha \in \Lambda$. Notice that the basis for the product topology is given by

$$\mathcal{B} := \left\{ \bigcap_{\alpha \in \Lambda'} \pi_{X_\alpha}^{-1}(U_\alpha) : \Lambda' \subseteq \Lambda \text{ is finite, } U_\alpha \in \mathcal{T}_\alpha \right\}.$$

For any finite $\Lambda' \subseteq \Lambda$, we have

$$\begin{aligned} f^{-1}\left(\bigcap_{\alpha \in \Lambda'} \pi_{X_\alpha}^{-1}(U_\alpha)\right) &= \bigcap_{\alpha \in \Lambda'} f^{-1}(\pi_{X_\alpha}^{-1}(U_\alpha)) \\ &= \bigcap_{\alpha \in \Lambda'} (\pi_{X_\alpha} \circ f)^{-1}(U_\alpha) \\ &= \bigcap_{\alpha \in \Lambda'} f_\alpha^{-1}(U_\alpha), \end{aligned}$$

which is open. Therefore, f is continuous. □

Notice that it is important to equip the product space with the product topology. Let $f : \mathbb{R} \rightarrow \mathbb{R}^{\mathbb{N}}$ such that $f(x) = (x, x, \dots)$. We claim that f is not continuous with respect to the box topology.

The following result should be common sense enough.

Corollary 1.6.6 ► Arithmetic of Continuous Functions

Let X be a topological space and let $f, g : X \rightarrow \mathbb{R}$ be continuous functions, then the functions $f + g$, $f - g$ and fg are continuous. If $0 \notin g(X)$, then $\frac{f}{g}$ is continuous.

Intuitively, the subspace topology on product space should be the product of subspace topologies.

Proposition 1.6.7 ▶ Subspace Topology on Product Spaces

Let (X, \mathcal{T}_X) and (Y, \mathcal{T}_Y) be topological spaces. Let $A \subseteq X$, $B \subseteq Y$ and $\mathcal{T}_{A \times B}$ be the subspace topology on $A \times B$ induced by the product topology. If $\mathcal{T}'_{A \times B}$ be the product topology induced by the subspace topologies on A and B , then $\mathcal{T}_{A \times B} = \mathcal{T}'_{A \times B}$.

Proof. Let \mathcal{T}_A and \mathcal{T}_B be the subspace topologies on A and B respectively, then $\mathcal{T}'_{A \times B}$ is generated by the basis

$$\mathcal{B}' := \{T_A \times T_B : T_A \in \mathcal{T}_A, T_B \in \mathcal{T}_B\}.$$

Let $\mathcal{T}_{X \times Y}$ be the product topology for $X \times Y$, then $\mathcal{T}_{X \times Y}$ is generated by

$$\mathcal{B}_{X \times Y} := \{U_X \times U_Y : U_X \in \mathcal{T}_X, U_Y \in \mathcal{T}_Y\}.$$

Therefore, by Proposition 1.3.2, $\mathcal{T}_{A \times B}$ is generated by

$$\mathcal{B} := \{(U_X \times U_Y) \cap (A \times B) : U_X \in \mathcal{T}_X, U_Y \in \mathcal{T}_Y\}.$$

It is clear that $\mathcal{B} = \mathcal{B}'$ (???). □

Proposition 1.6.8 ▶ Standard Topology Decomposition on Euclidean Spaces

Let $n \in \mathbb{Z}^+$ and $n = \sum_{i=1}^k m_i$ with $m_i \in \mathbb{Z}^+$ for $i = 1, 2, \dots, k$. Let \mathcal{T}_i be the standard topology on \mathbb{R}^{m_i} and \mathcal{T} be the product topology induced by the \mathcal{T}_i 's, then \mathcal{T} is the standard topology on \mathbb{R}^n .

Proof. Let \mathcal{B}_n be the standard basis generating the standard topology \mathcal{T}_n over \mathbb{R}^n for each $n \in \mathbb{N}^+$. Take any $B_r^{(n)}(\mathbf{x}) \in \mathcal{B}_n$. For any $\mathbf{y} \in B_r^{(n)}(\mathbf{x})$, define $t = r - \|\mathbf{x} - \mathbf{y}\|$ and consider, for each $i = 1, 2, \dots, k$,

$$B_t^{(m_i)}(\pi_{\mathbb{R}^{m_i}}(\mathbf{y})) \in \mathcal{B}_{m_i} \subseteq \mathcal{T}_i$$

to be an open ball centred at the projection of \mathbf{y} to the m_i -th factor. Denote

$$B_t := \prod_{i=1}^k B_t^{(m_i)}(\pi_{\mathbb{R}^{m_i}}(\mathbf{y})).$$

Clearly, B_t is contained by the basis for the product topology induced by the \mathcal{T}_i 's. For any $\mathbf{p} \in B_t$, we have

$$\|\mathbf{p} - \mathbf{x}\| \leq \|\mathbf{p} - \mathbf{y}\| + \|\mathbf{x} - \mathbf{y}\| < r.$$

Therefore, $\mathbf{y} \in B_t \subseteq B_r^{(n)}(\mathbf{x})$. By Proposition 1.1.7, $\mathcal{T} \subseteq \mathcal{T}_n$. Conversely, take an arbitrary $U_i \in \mathcal{T}_i$ for each $i = 1, 2, \dots, k$. Notice that for any $\mathbf{x} \in \prod_{i=1}^k U_i$, there is some open ball $B_{r_i}^{(m_i)}(\pi_{\mathbb{R}^{m_i}}(\mathbf{x})) \in \mathcal{B}_{m_i}$, centred at the projection of \mathbf{x} to the m_i -th factor, such that $B_{r_i}^{(m_i)}(\pi_{\mathbb{R}^{m_i}}(\mathbf{x})) \subseteq U_i$. Take

$$r := \min_{1 \leq i \leq k} r_i$$

and consider the open ball $B_r^{(n)}(\mathbf{x}) \in \mathcal{B}_n$. For any $\mathbf{y} \in B_r^{(n)}(\mathbf{x})$, consider

$$\|\mathbf{y} - \mathbf{x}\| = \sum_{i=1}^k \|\pi_{\mathbb{R}^{m_i}}(\mathbf{y}) - \pi_{\mathbb{R}^{m_i}}(\mathbf{x})\| < r \leq \min_{1 \leq i \leq k} r_i.$$

Therefore, for every positive integer $i \leq k$, we have

$$\|\pi_{\mathbb{R}^{m_i}}(\mathbf{y}) - \pi_{\mathbb{R}^{m_i}}(\mathbf{x})\| < r_i,$$

which implies that $\pi_{\mathbb{R}^{m_i}}(\mathbf{y}) \in B_{r_i}^{(m_i)}(\pi_{\mathbb{R}^{m_i}}(\mathbf{x})) \subseteq U_i$. Therefore, $\mathbf{y} \in \prod_{i=1}^k U_i$ and so $\mathcal{T}_n \subseteq \mathcal{T}$ by Proposition 1.1.7. Therefore, $\mathcal{T} = \mathcal{T}_n$. \square

Definition 1.6.9 $\blacktriangleright L^p$ -Metric

Let $(X_1, d_{X_1}), (X_2, d_{X_2}), \dots, (X_n, d_{X_n})$ be metric spaces, we define

$$d_1((x_1, x_2, \dots, x_n), (y_1, y_2, \dots, y_n)) := \sum_{i=1}^n d_{X_i}(x_i, y_i)$$

$$d_\infty((x_1, x_2, \dots, x_n), (y_1, y_2, \dots, y_n)) := \max_{1 \leq i \leq n} d_{X_i}(x_i, y_i).$$

Proposition 1.6.10 \blacktriangleright Basis for Product Topology

Let $\{(X_i, \mathcal{T}_i)\}_{i=1}^n$ be a sequence of topological spaces and let \mathcal{B}_i be the basis for \mathcal{T}_i for all $i = 1, 2, \dots, n$, then $\prod_{i=1}^n \mathcal{B}_i$ is a basis for the product topology over $\prod_{i=1}^n X_i$.

Proposition 1.6.11 \blacktriangleright Metric for Product Topology

Let $\{(X_i, d_{X_i})\}_{i=1}^n$ be a sequence of topological spaces, then d_1 and d_∞ both induce the product topology over $\prod_{i=1}^n X_i$.

Proposition 1.6.12 ▶ ρ -Metric Induces the Same Topology

Let (X, d) be a metric space and define $\rho : X \times X \rightarrow \mathbb{R}$ by

$$\rho(x, y) := \frac{d(x, y)}{1 + d(x, y)},$$

then ρ is a metric on X and $\text{diam}_\rho(X) < 1$. Let \mathcal{T}_ρ and \mathcal{T}_d be the topologies on X induced by ρ and d respectively, then $\mathcal{T}_\rho = \mathcal{T}_d$.

Proof. We first show that ρ is a metric. The non-negativity and symmetry are obvious, so it suffices to prove the triangle inequality. Consider

$$f(t) = \frac{t}{1+t}.$$

One may check that f is an increasing concave function with $f(0) = 0$. Therefore,

$$\frac{b}{a+b}f(a+b) = \frac{a}{a+b}f(0) + \frac{b}{a+b}f(a+b) \leq f(b).$$

By symmetry, $\frac{a}{a+b}f(a+b) \leq f(a)$, and so $f(a) + f(b) \geq f(a+b)$. Therefore, for any $x, y, z \in X$,

$$\begin{aligned} \rho(x, y) + \rho(y, z) &= f(d(x, y)) + f(d(y, z)) \\ &\geq f(d(x, y) + d(y, z)) \\ &\geq f(d(x, z)) \\ &= \rho(x, z). \end{aligned}$$

It is clear that $\text{diam}_\rho(X) = \max_{(x,y) \in X^2} \rho(x, y) < 1$. Notice that

$$\begin{aligned} 2\rho(x, y) &= \frac{2d(x, y)}{1 + d(x, y)} \\ &> d(x, y) \\ &> \rho(x, y) \end{aligned}$$

for all $x, y \in X$. Therefore, $\mathcal{T}_d = \mathcal{T}_\rho$. □

Proposition 1.6.13 ▶ Product Topology on Infinite Product

Let $\{(X, d_{X_i})\}_{i=1}^{\infty}$ be a sequence of metric spaces and define $\rho_i : X_i \times X_i \rightarrow \mathbb{R}$ by

$$\rho_i(x, y) := \frac{d_{X_i}(x, y)}{1 + d_{X_i}(x, y)},$$

then $d : \prod_{i=1}^{\infty} X_i \times \prod_{i=1}^{\infty} X_i \rightarrow \mathbb{R}$ defined by

$$d(\mathbf{x}, \mathbf{y}) := \sup \left\{ \frac{\rho_i(x_i, y_i)}{i} : i \in \mathbb{Z}^+ \right\}$$

is a metric inducing the product topology on $\prod_{i=1}^{\infty} X_i$.

Proof. Define $\rho'_i = \frac{1}{i}\rho_i$. Let \mathcal{B}_d be the basis induced by the metric d and \mathcal{B}_i be the basis induced by the metric ρ'_i . Take any $B_r^d(\mathbf{x}) \in \mathcal{B}_d$. For any $\mathbf{y} \in B_r^d(\mathbf{x})$, we have

$$\frac{\rho_i(x_i, y_i)}{i} \leq d(\mathbf{x}, \mathbf{y}) < r$$

for all $i \in \mathbb{Z}^+$. Therefore, $\mathbf{y} \in B_r^{\rho'_i}$ and so $B_r^d(\mathbf{x}) \subseteq \prod_{i=1}^{\infty} B_r^{\rho'_i}$. For any $\mathbf{x} \in \prod_{i=1}^{\infty} X_i$, Notice that for any $r > 0$, there exists some $N \in \mathbb{N}^+$ such that $\frac{1}{i} < \frac{r}{2}$ for all $i \geq N$. By Proposition 1.6.12, $\text{diam}(\rho_i) < 1$ for all $i \in \mathbb{N}^+$, so

$$\text{diam}\left(\frac{1}{i}\rho_i\right) = \frac{1}{i}\text{diam}(\rho_i) < r$$

whenever $i \geq N$. Therefore, $B_r^{\rho'_i}(\mathbf{x}_i) = X_i$ for any $\mathbf{x}_i \in X_i$. This means that for any $\mathbf{x} \in \prod_{i=1}^{\infty} X_i$, we can write

$$B_r^d(\mathbf{x}) = \prod_{i=1}^{N-1} B_r$$

□

1.7 Quotient Topological Spaces

Definition 1.7.1 ▶ Quotient Map

Let (X, \mathcal{T}_X) and (Y, \mathcal{T}_Y) be topological spaces. A surjective map $p : X \rightarrow Y$ is a **quotient map** if for all $V \subseteq Y$, $V \in \mathcal{T}_Y$ if and only if $p^{-1}(V) \subseteq X$ is open in X .

Definition 1.7.2 ▶ Open and Closed Maps

A continuous map $f : X \rightarrow Y$ is **open** if $f(U)$ is open in Y for any open set $U \subseteq X$, and **closed** if $f(V)$ is closed in Y for any closed set $V \subseteq X$.

Remark. If a surjective continuous map is open or closed, then it is a quotient map.

Remark. Quotient map, open map and closed map are all preserved under composition.

Definition 1.7.3 ▶ Saturated Set

Let $f : X \rightarrow Y$ be a surjective continuous map. A set $A \subseteq X$ is **saturated** with respect to f if $A = f^{-1}(S)$ for some $S \subseteq Y$.

Equivalently, this means that $A = f^{-1}(f(A))$.

Proposition 1.7.4 ▶ Equivalent Definition for Quotient Maps

Let $f : X \rightarrow Y$ be a surjective continuous map, then f is a quotient map if and only if $f(A)$ is open (closed) in Y whenever A is a saturated open (closed) set with respect to f in X .

Proof. Take any saturated open set $A \subseteq X$, then $A = f^{-1}(f(A))$. By definition 1.7.1, since $f^{-1}(f(A))$ is open, $f(A)$ must be open in Y . Conversely, suppose that $f(A)$ is open in Y for all saturated open set $A \subseteq X$. Let $U \subseteq Y$ such that $f^{-1}(U)$ is open in X . Notice that $f^{-1}(U)$ is saturated. Therefore, $f(f^{-1}(U)) = U$ is open in Y . Since f is surjective, it is a quotient map. \square

Proposition 1.7.5 ▶ Restriction of Quotient Map to Saturated Open Sets

If $f : X \rightarrow Y$ is a continuous quotient map and $A \subseteq X$ is a saturated open (closed) set with respect to f , then $f|_A : A \rightarrow f(A)$ is a quotient map.

Proof. Let $B \subseteq A$ be open and saturated with respect to $f|_A$, then $B = f|_A^{-1}(f|_A(B))$. Note that

$$f|_A(B) = f(B \cap A) = f(B)$$

for any $B \subseteq A$. Since B is open, by Proposition 1.7.4, $f(B)$ is open. This implies that $f|_A$ is a quotient map. \square

Proposition 1.7.6 ► Existence and Uniqueness of Quotient Topology

Let $p : X \rightarrow A$ be surjective for some $A \subseteq X$, then there exists a unique topology \mathcal{T}_A such that p is a quotient map.

Proof. Define

$$\mathcal{T}_A := \{U \subseteq A : p^{-1}(U) \subseteq X \text{ is open}\}.$$

Observe that $\emptyset, A \in \mathcal{T}_A$. Note that for any index set Λ such that $U_\alpha \in \mathcal{T}_A$ for all $\alpha \in \Lambda$,

$$p^{-1}\left(\bigcup_{\alpha \in \Lambda} U_\alpha\right) = \bigcup_{\alpha \in \Lambda} p^{-1}(U_\alpha)$$

is open in X , so $\bigcup_{\alpha \in \Lambda} U_\alpha \in \mathcal{T}_A$. Similarly, one may check that $\bigcup_{i=1}^n U_i \in \mathcal{T}_A$ for any $n \in \mathbb{N}^+$ such that $U_i \in \mathcal{T}_A$ for all $i = 1, 2, \dots, n$. Let \mathcal{T}' be any topology on A such that p is a quotient map. For any $U \subseteq A$, notice that $U \in \mathcal{T}'$ if and only if $p^{-1}(U) \subseteq X$ is open, i.e., $U \in \mathcal{T}'$ if and only if $U \in \mathcal{T}_A$. Therefore, $\mathcal{T}' = \mathcal{T}_A$, which means that \mathcal{T}_A is unique. \square

Definition 1.7.7 ► Quotient Space

Let X be a topological space and X^* be a partition of X . Let $p : X \rightarrow X^*$ be a surjective map such that $x \in p(x)$. If \mathcal{T}^* is the quotient topology on X^* , then (X^*, \mathcal{T}^*) is the **quotient space** of X .

Characterisation of Topological Spaces

2.1 Hausdorff Spaces

Definition 2.1.1 ► T_1 and T_2 Spaces

Let X be a topological space. X is T_1 if for any $x, y \in X$ with $x \neq y$, there exists an open set $U \subseteq X$ such that $x \in U$ but $y \notin U$. X is T_2 or **Hausdorff** if for any $x, y \in X$ with $x \neq y$, there exist open neighbourhoods $U, V \subseteq X$ with $x \in U$ and $y \in V$ such that $U \cap V = \emptyset$.

We can check that every metric space is Hausdorff, as for any $x \neq y$, we can always take

$$r := \frac{1}{3}d(x, y),$$

and so the r -neighbourhoods of x and y will always be disjoint. It can also be easily checked that the discrete topology of any set is Hausdorff.

Proposition 2.1.2 ► Characterisation of T_1 Spaces

A topological space X is T_1 if and only if for all $x \in X$, the singleton set $\{x\}$ is closed.

Proof. Suppose that X is T_1 and take any $x \in X$. Let $y \in X \setminus \{x\}$ be any point. Notice that there exists some open set $V_y \subseteq X$ such that $y \in V_y$ but $x \notin V_y$. Clearly,

$$X \setminus \{x\} = \bigcup_{y \in X \setminus \{x\}} V_y$$

is open, and so $\{x\}$ is closed. Conversely, suppose that for all $x \in X$, the set $\{x\}$ is closed. For any $x \in X$, take any $y \in X$ with $x \neq y$. Notice that $y \in X \setminus \{x\}$, which is open. Therefore, X is T_1 . □

Corollary 2.1.3 ► Finite Sets in Metric Spaces Are Closed

Let X be a metric space, then all finite sets in X are closed.

2.2 First Countable Spaces

Definition 2.2.1 ► Countable Basis

Let X be a topological space. For all $x \in X$, a **countable basis** of x is a countable collection \mathcal{B} of open sets in X containing x such that for any open set $Y \subseteq X$ containing x , there exists some $B \in \mathcal{B}$ with $B \subseteq Y$.

Definition 2.2.2 ► First Countable Space

A topological space X is **first countable** if every $x \in X$ has a countable basis.

We claim that all metric spaces are first countable. Let X be a metric space and take any $x \in X$, then we can take its countable basis as

$$\mathcal{B} := \left\{ B_{\frac{1}{i}}(x) : i \in \mathbb{Z}^+ \right\}.$$

Consider some uncountable set Y equipped with the co-finite topology. For any $y \in Y$, suppose it has a countable basis \mathcal{B} . Note that in the co-finite topology, a set is open if and only if its complement is finite. Therefore, there exists some finite set $F_i \subseteq Y$ such that there exists some $B_i \in \mathcal{B}$ such that $Y \setminus F_i = B_i$. Notice that

$$Y \setminus \left(\{y\} \cup \bigcup_{i=1}^{\infty} F_i \right) \neq \emptyset.$$

Take some $z \in Y \setminus (\{y\} \cup \bigcup_{i=1}^{\infty} F_i)$, then $U := Y \setminus \{z\}$ is open such that $y \in U$. Note that for all $B_i \in \mathcal{B}$, we have $z \in B_i$. This means that $B_i \not\subseteq U$ for all $i \in \mathbb{Z}^+$ because otherwise $y \in U$ which is not possible. Therefore, \mathcal{B} is not a countable basis.

Proposition 2.2.3 ► Closure Characterisation of First Countable Spaces

Let X be a topological space and $A \subseteq X$. If there exists a sequence $\{x_i\}_{i \in \mathbb{N}^+} \subseteq A$ such that $x_i \rightarrow x$, then $x \in \bar{A}$. The converse is true if X is first countable.

Proof. Suppose that there exists a sequence $\{x_i\}_{i \in \mathbb{N}^+} \subseteq A$ such that $x_i \rightarrow x$. Notice that $\bar{A} = A \cup A'$, then it suffices to prove that $x \notin A$ implies that $x \in A'$. Suppose that $x \notin A$. Note that for any open set $U \subseteq X$ such that $x \in U$, there exists some $N \in \mathbb{N}$ such that $x_n \in U$ for all $n \geq N$. In particular, this means that $x_N \in U \cap (A \setminus \{x\})$. Therefore, x is a limit point of A .

Conversely, suppose that $x \in \bar{A}$. Since X is first countable, x has some count-

able basis \mathcal{X} . For each $i \in \mathbb{N}^+$, take

$$x_i \in \bigcap_{j=1}^i (B_j \cap A),$$

then $\{x_i\}_{i \in \mathbb{N}^+}$ is a sequence in A . Let U be any open set containing x , then there exists some $B_N \in \mathcal{B}$ such that $x \in B_N \subseteq U$. However, notice that for all $i \geq N$, we have $x_i \in B_N \subseteq U$, and so $x_i \rightarrow x$. \square

Proposition 2.2.4 ► Continuous Map Characterisation of First Countable Spaces

Let X be a topological space. If $f : X \rightarrow Y$ is continuous, then for any sequence $\{x_i\}_{i \in \mathbb{N}^+}$ with $x_i \rightarrow x$, then $f(x_i) \rightarrow f(x)$. The converse is true if X is first countable.

Proof. Suppose that $f : X \rightarrow Y$ is continuous. Let $U \subseteq Y$ be an open set such that $f(x) \in U$, then $x \in f^{-1}(U)$, which is open. Note that there exists some $N \in \mathbb{N}^+$ such that $x_i \in f^{-1}(U)$ for all $i \geq N$, i.e., $f(x_i) \in U$ for all $i \geq N$. Therefore, $f(x_i) \rightarrow f(x)$.

Conversely, suppose that for any sequence $\{x_i\}_{i \in \mathbb{N}^+}$ with $x_i \rightarrow x$, then $f(x_i) \rightarrow f(x)$. Take any $A \subseteq X$ with $x \in \bar{A}$. Since X is first countable, by Proposition 2.2.3, there exists a sequence $\{y_i\}_{i \in \mathbb{N}^+}$ in A such that $y_i \rightarrow x$. This means that $f(y_i) \rightarrow f(x)$. Since $f(y_i) \in f(A)$, this means that $f(x) \in \overline{f(A)}$, and so $f(\bar{A}) \subseteq \overline{f(A)}$. By Proposition 1.5.4, f is continuous. \square

2.3 Compactness

Definition 2.3.1 ► Open Cover

Let X be a topological space. An **open cover** is a collection of open sets $\{U_\alpha\}_{\alpha \in \Lambda}$ such that

$$\bigcup_{\alpha \in \Lambda} U_\alpha = X.$$

Definition 2.3.2 ► Compact Space

Let X be a topological space. X is **compact** if every open cover of X contains a finite sub-cover for X .

Remark. $Y \subseteq X$ is a compact subspace if and only if every collection \mathcal{U} of open sets in Y such that $Y \subseteq \bigcup_{U \in \mathcal{U}} U$ contains a finite sub-collection $\mathcal{U}' \subseteq \mathcal{U}$ such that $Y \subseteq \bigcup_{U \in \mathcal{U}'} U$.

Proposition 2.3.3 ► Closed Subspaces of Compact Spaces Are Compact

Every closed subspace of a compact space is compact.

Proposition 2.3.4 ► Continuous Map Induces Compact Image

Let $f : X \rightarrow Y$ be continuous, if X is compact, then $f(X)$ is compact.
